HACKWEEK 2026

IDENTITY HACKATHON

PROJECT REPORT

BUILD / INNOVATE / IDENTIFY

AI Use Declaration

This declaration should list every AI tool used on the project or its documentation. Based on the work recorded for this project, ChatGPT was used for assistance with planning, debugging, documentation, and related development questions. Update this table if any other AI tools were used.

AI Use Declaration	What I asked it to do	What I wrote, changed or checked myself
ChatGPT	Help plan the next development steps and explain implementation issues during GroceryMate development.	I made the implementation decisions, applied changes in my project, and needed to run or inspect the application and database to verify the result.
ChatGPT	Help investigate database errors, including foreign-key/data consistency issues, and draft SQL statements for catalogue or related records.	I checked the actual schema and database output, adapted statements to the available columns and records, and should verify all resulting data in the database.
ChatGPT	Help reason about security-token errors and review code or testing questions.	I applied and checked changes against the actual project; any security behaviour should be verified through tests and code review.
ChatGPT	Help prepare project documentation, including the README-related work, architecture explanation, project story, and this declaration.	I reviewed the generated wording, must correct anything that does not match the submitted build, and remain responsible for explaining the project and its code.
Google Gemini	Debug terminal Git tracking issues, untrack build artifacts (target/, .idea/), and establish correct .gitignore patterns.	Audited staged Git files via git status, wrote custom .gitignore rules, and removed accidental root files (main) before committing
Google Gemini	Guide Dockerfile packaging, containerization, and configuration for deploying Spring Boot on Render with TiDB Cloud MySQL and static UI on Vercel.	Created environment variable fallbacks in application.properties, secured production database credentials inside Render environment settings, and verified live CORS preflight (OPTIONS 200 OK) and end-to-end authentication

Declaration: I/We confirm that this entry is our own work, that every AI tool used is listed above, and that I/we can explain every part of the submitted code.
