GroceryMate — Project Story and Development Journey

1. The Problem

Managing household groceries can be difficult. People may forget what is available, run out of essential items, or struggle to plan when to buy more.

GroceryMate aims to make household grocery management simpler and more organised.

2. The Idea

GroceryMate is a web application designed to help households manage grocery inventory and purchasing needs in one place. It supports account access, household-related data, grocery catalogue management, stock tracking, and purchase-related workflows.

3. Development Journey

- **Problem Identification:** Recognised the need for better grocery tracking and replenishment planning.
- **Application Design:** Planned a web application using a browser interface, JavaScript, a Java backend, and a database.
- **Authentication:** Implemented sign-up and login, reported as working during development.
- **Database Development:** Organised grocery catalogue, household, inventory, and purchase-related data.
- **Integration and Debugging:** Connected the interface to backend APIs and resolved database relationship and security-token issues.
- **Testing and Documentation:** Prepared project documentation and identified areas requiring further testing.

4. Main Objectives

- Organise household grocery information.
- Track remaining quantities and low-stock levels.
- Estimate when items may need replenishment.
- Support household and purchasing workflows.
- Store and manage information through a structured web application.

5. Current Status

Sign-up and login are reported as working, and database structures and application workflows have been developed and debugged. However, every feature still needs appropriate verification before it can be considered fully tested. Refill estimates depend on accurate data and application logic.
